

TITLE: Write the python to implement Travelling Salesman Problem

CODE:

```
import itertools
```

```
def calculate_distance(points):  
    total_distance = 0  
    for i in range(len(points) - 1):  
        total_distance += distance(points[i], points[i+1])  
    # Add distance from the last point back to the starting  
    point  
    total_distance += distance(points[-1], points[0])  
    return total_distance
```

```
def distance(point1, point2):  
    return ((point1[0] - point2[0])**2 + (point1[1] -  
point2[1])**2) ** 0.5
```

```
def traveling_salesman_brute_force(points):  
    min_distance = float('inf')  
    min_path = None  
    for perm in itertools.permutations(points):
```

```

    current_distance = calculate_distance(perm)

    if current_distance < min_distance:
        min_distance = current_distance
        min_path = perm

    return min_path, min_distance

if __name__ == "__main__":
    # Example points (x, y)
    points = [(0, 0), (1, 2), (2, 3), (4, 5)]

    min_path, min_distance =
traveling_salesman_brute_force(points)

    print("Minimum Distance:", min_distance)

    print("Minimum Path:", min_path)

```

OUTPUT:

```
